

**Figure 1.** Map of candidate donor (green) and recipient (red) sites along the central and southern California mainland and Channel Islands. Approximately 5 recipient sites per region (central CA, southern CA, and the Channel Islands) will be utilized for rockweed restoration.

**Figure 2.** A typical rockweed (*Silvetia compressa*) bed (top) with multiple individuals. Fertile adults from donor sites (bottom left) will be attached to the substrate at recipient sites using marine epoxy (bottom right).
